- 1 Higgs - observations
- 2 Higgs - theory
- 3 Fits
- 4 Invisible Partial Width
- 5 What if...

- The SM Higgs with mass  $m_h \ll 2m_W$  has many decay channels that are potentially observable at the LHC and Tevatron ( $H \rightarrow ZZ^*$ ,  $H \rightarrow \gamma\gamma$ ,  $H \rightarrow b\bar{b}$   $H \rightarrow WW^*$ ,  $H \rightarrow \tau^+\tau^-$ ).
- Also different production channels can be isolated (gluon fusion, vector boson fusion, W/Z and  $t\bar{t}$  associated production)
- Rich Higgs physics available in near future
- If new physics exists, Higgs interactions likely to be modified
- If new physics restores naturalness, Higgs interactions are necessarily modified
- Measuring Higgs rates at the LHC may be the shortest route to new physics!

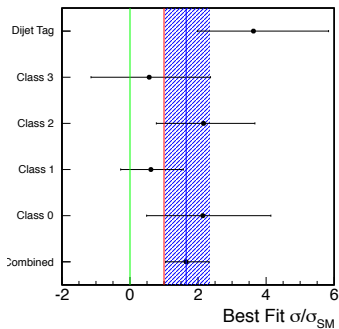

# Hierarchy problem and Higgs physics

*stolen from R. Rattazzi*

Higgs

Observations

- Significant background, but great mass resolution
- Both ATLAS and CMS observe an excess near  $m_h \sim 125$  GeV, ATLAS centered at 126 and CMS centered at 125
- In both case the best fit cross section at the peak exceeds the SM value, though the latter is well within uncertainties
- CMS also observes an excess in inclusive  $\gamma\gamma jj$  channel dominated by VBF production mode, corresponding to cross section well exceeding the SM one (though, again, uncertainties are still large)

- Very low background, great mass resolution
- ATLAS has 3 events at  $m_{4l} \approx 124 \text{ GeV}$
- CMS has 2 events at  $m_{4l} \approx 126 \text{ GeV}$

	Signal	WW	WZ/ZZ/W $\gamma$	$t\bar{t}$	$tW/tb/tqb$	Z/ $\gamma^*$ + jets	W + jets	Total Bkg.	Obs.	
$0 \leq  \eta  \leq 1$	$m_H = 125 \text{ GeV}$	$25 \pm 7$	$110 \pm 12$	$12 \pm 3$	$7 \pm 2$	$5 \pm 2$	$13 \pm 8$	$27 \pm 16$	$173 \pm 22$	174
	$m_H = 240 \text{ GeV}$	$60 \pm 17$	$432 \pm 49$	$24 \pm 3$	$68 \pm 15$	$39 \pm 9$	$8 \pm 2$	$36 \pm 24$	$607 \pm 63$	629
$1 \leq  \eta  \leq 2$	$m_H = 125 \text{ GeV}$	$6 \pm 2$	$18 \pm 3$	$6 \pm 3$	$7 \pm 2$	$4 \pm 2$	$6 \pm 1$	$5 \pm 3$	$45 \pm 7$	56
	$m_H = 240 \text{ GeV}$	$23 \pm 9$	$99 \pm 22$	$8 \pm 1$	$73 \pm 27$	$35 \pm 19$	$6 \pm 2$	$7 \pm 7$	$229 \pm 55$	232
$2 \leq  \eta  \leq 3$	$m_H = 125 \text{ GeV}$	$0.4 \pm 0.2$	$0.3 \pm 0.2$	negl.	$0.2 \pm 0.1$	negl.	$0.0 \pm 0.1$	negl.	$0.5 \pm 0.2$	0
	$m_H = 240 \text{ GeV}$	$2.5 \pm 0.6$	$1.1 \pm 0.7$	$0.1 \pm 0.1$	$2.6 \pm 1.3$	$0.3 \pm 0.3$	negl.	$0.1 \pm 0.1$	$4.2 \pm 1.7$	2

- Significant background, poor mass resolution, better for exclusion than discovery
- No clear excess here, which begins to feel weird
- Bad luck, background misestimation, or something interesting going on?

# Exclusion limits

- Low mass range excluded by Tevatron and LHC except for 122-127 GeV range
- Even lower mass range excluded by LEP,
- High mass range excluded by LHC, or highly disfavored by EWPT
- Within the SM, no more "elsewhere"!

# $VH \rightarrow b\bar{b}$ at Tevatron

- Points to somewhat enhanced rate in  $VH$  production channel, the heavier Higgs, the larger cross section boost is needed
- Doesn't strongly favor any mass between 120 and 135 GeV

Experimentalists:

*Not enough data to conclude the existence  
or non-existence of the Higgs boson*

Theorists:

*Come on... it's 125 GeV*

This talk:

*Assuming Higgs exists at 125 GeV  
what's next?*

Next

*Is it the SM Higgs?*

# Higgs Theory

Define effective Higgs Lagrangian at  $\mu \approx m_h \sim 125\text{GeV}$ . Couplings relevant for current LHC data

$$\begin{aligned} \mathcal{L}_{\text{eff}} = & c_V \frac{2m_W^2}{v} h W_\mu^+ W_\mu^- + c_V \frac{m_Z^2}{v} h Z_\mu Z_\mu - c_b \frac{m_b}{v} h \bar{b}b - c_\tau \frac{m_\tau}{v} h \bar{\tau}\tau \\ & + c_g \frac{\alpha_s}{12\pi v} h G_{\mu\nu}^a G_{\mu\nu}^a + c_\gamma \frac{\alpha}{\pi v} h A_{\mu\nu} A_{\mu\nu} \end{aligned}$$

- Few theoretical prejudices here:
  - Assuming Higgs couples to SM fields only
  - Custodial symmetry fixing  $c_W = c_Z \equiv c_V$  (otherwise quadratically divergent contributions  $\Delta T$ )
  - Scalar (rather than pseudoscalar) interactions only
- Top already integrated out, contributing to  $c_g$  and  $c_\gamma$
- SM predicts  $1 = c_V = c_b \approx c_g$  and  $c_\gamma = 2/9$
- Any of the couplings can be modified in specific scenarios beyond the SM
- All LHC Higgs rates can be easily expressed as functions of the  $c_i$  couplings

Higgs decay widths relative to SM modified approximately as,

$$\begin{aligned}
 \frac{\Gamma(h \rightarrow b\bar{b})}{\Gamma_{SM}(h \rightarrow b\bar{b})} &\simeq |c_b|^2 \\
 \frac{\Gamma(h \rightarrow WW^*)}{\Gamma_{SM}(h \rightarrow WW^*)} = \frac{\Gamma(h \rightarrow ZZ^*)}{\Gamma_{SM}(h \rightarrow ZZ^*)} &\simeq |c_V|^2 \\
 \frac{\Gamma(h \rightarrow gg)}{\Gamma_{SM}(h \rightarrow gg)} &\simeq |c_g|^2 \\
 \frac{\Gamma(h \rightarrow \gamma\gamma)}{\Gamma_{SM}(h \rightarrow \gamma\gamma)} &\simeq \left| \frac{\hat{c}_\gamma}{\hat{c}_{\gamma,SM}} \right|^2 \quad (1)
 \end{aligned}$$

where, taking into account W loop and assuming  $m_h \approx 125$  GeV ,  
 $\hat{c}_\gamma \approx c_\gamma - c_V$ , and  $\hat{c}_{\gamma,SM} \approx -0.8$

For  $m_h \sim 125$  GeV total Higgs width scales as

$$\frac{\Gamma_{tot}}{\Gamma_{tot,SM}} \approx 0.61c_b^2 + 0.24c_V^2 + 0.09c_g^2 + 0.06c_\tau^2 \equiv c_{tot}^2$$

Assuming  $H \rightarrow bb$  dominates Higgs widths

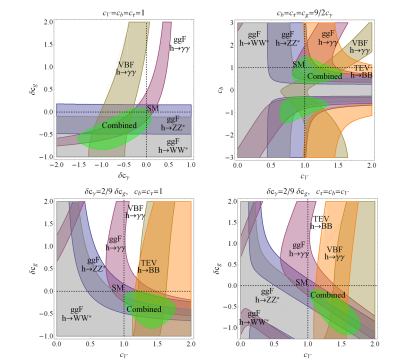

$$\begin{aligned} R_{VV^*} &\equiv \frac{\sigma(pp \rightarrow h)\text{Br}(h \rightarrow ZZ^*)}{\sigma_{SM}(pp \rightarrow h)\text{Br}_{SM}(h \rightarrow ZZ^*)} \simeq \left| \frac{c_g c_V}{c_{tot}} \right|^2, \\ R_{\gamma\gamma} &\equiv \frac{\sigma(pp \rightarrow h)\text{Br}(h \rightarrow \gamma\gamma)}{\sigma_{SM}(pp \rightarrow h)\text{Br}_{SM}(h \rightarrow \gamma\gamma)} \simeq \left| \frac{c_g \hat{c}_\gamma}{\hat{c}_{\gamma,SM} c_{tot}} \right|^2, \\ R_{\gamma\gamma}^{VBF} &\equiv \frac{\sigma(pp \rightarrow hjj)\text{Br}(h \rightarrow \gamma\gamma)}{\sigma_{SM}(pp \rightarrow hjj)\text{Br}_{SM}(h \rightarrow \gamma\gamma)} \simeq \left| \frac{c_V \hat{c}_\gamma}{\hat{c}_{\gamma,SM} c_b} \right|^2. \\ R_{bb}^{\text{TeV}} &\equiv \frac{\sigma(p\bar{p} \rightarrow Vh)\text{Br}(h \rightarrow b\bar{b})}{\sigma_{SM}(p\bar{p} \rightarrow Vh)\text{Br}_{SM}(h \rightarrow b\bar{b})} \simeq \left| \frac{c_V^2 c_b^2}{c_{tot}^2} \right|, \end{aligned} \quad (2)$$

$$\begin{aligned} \mathcal{L}_{\text{eff}} = & \quad c_V \frac{2m_W^2}{v} h W_\mu^+ W_\mu^- + c_V \frac{m_Z^2}{v} h Z_\mu Z_\mu - c_b \frac{m_b}{v} h \bar{b}b - c_b \frac{m_\tau}{v} h \bar{\tau}\tau \\ & + c_g \frac{\alpha_s}{12\pi v} h G_{\mu\nu}^a G_{\mu\nu}^a + c_\gamma \frac{\alpha}{\pi v} h A_{\mu\nu} A_{\mu\nu} \end{aligned}$$

- [Carmi+ \[1202.3144\]](#) : determine the region of effective theory parameter space favored by current Higgs data
- Question whether the current LHC data are consistent with the SM Higgs
- Question whether they favor or disfavor any particular BSM scenario
- Of course at this stage one cannot make very strong statements about Higgs couplings (some of you don't even think Higgs has been discovered)
- Consider it warm-up exercise in preparation for better statistics
- Recently similar approach in [Azatov+ \[1202.3415\]](#) , [Espinosa+ \[1202.3697\]](#) , [Giardino+ \[1203.4254\]](#) , [Rauch \[1203.6826\]](#) , [Ellis, You \[1204.0464\]](#) , [Farina+ \[1205.0011\]](#) , [Klute+ \[1205.2699\]](#)

# Fits assuming $m_h = 125$ GeV

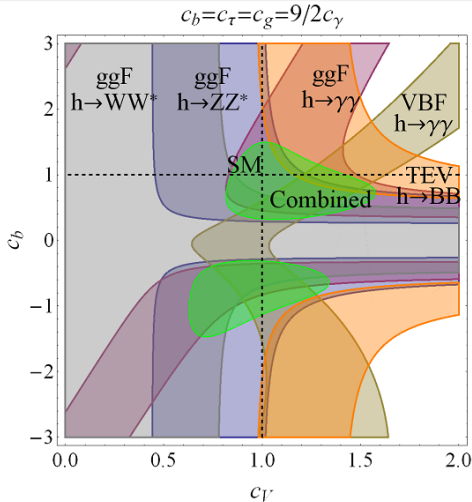

- We consider 2D planes in the parameter space
- Fixing all but 2 parameters (not marginalizing over) and fitting the remaining 2
- 1 sigma bands for 5 most sensitive search channels shown
- Combined =  $\Delta\chi^2 < 4.61$ , corresponding to 90% CL

- Only dimension-5 Higgs couplings allowed to vary (motivated if new physics enters only via loops)
- On this plane Tevatron never within 1 sigma band

# Fits assuming $m_h = 125\text{GeV}$

- Composite Higgs inspired parametrization (but couplings to fermions and gauge boson allowed to vary independently)
- Fermiophobic Higgs ( $c_b = 0$ ) disfavored
- Apart from SM-like Higgs, another favored region where sign of Higgs couplings flipped

# Scalar partner toy model

- Very toy "natural" model: just one scalar top partner (this is not SUSY, where at least two scalar partners are needed)
- Top partner interactions with Higgs to cancel top quadratic divergences

$$-(yHQ_t^c + \text{h.c.}) - |\tilde{t}|^2 (M^2 + 2y^2|H|^2).$$

- Only one free parameter: top partner mass  $m_{\tilde{t}}^2 = M^2 + y^2 v^2$
- New contributions to effective dimension 5 Higgs interactions

$$\frac{c_g}{c_{g,SM}} = \frac{c_\gamma}{c_{\gamma,SM}} \simeq 1 + \frac{m_{\tilde{t}}^2}{2m_{\tilde{t}}^2}$$

# Fermion partner model

- For fermionic top partner, non-renormalizable interactions with Higgs needed to cancel top quadratic divergence
- Simple model inspired by T-parity conserving Little Higgs

$$- (y \sin(|H|/f) Q t^c + \text{h.c.}) - y f \cos(|H|/f) T T^c$$

- Again only one free parameter: top partner mass  $m_T = y f \cos(v/\sqrt{2}f)$
- New contributions to effective dimension 5 Higgs interactions

$$\frac{c_g}{c_{g,\text{SM}}} = \frac{c_\gamma}{c_{\gamma,\text{SM}}} \simeq 1 - \frac{m_t^2}{m_T^2},$$

- Beginning of a beautiful friendship
- More Higgs data from LHC may favor/disfavor particular BSM scenarios...
- ...or just confirm the SM again

$$\begin{aligned}
 \mathcal{L}_{\text{eff}} = & c_V \frac{2m_W^2}{v} h W_\mu^+ W_\mu^- + c_V \frac{m_Z^2}{v} h Z_\mu Z_\mu - c_b \frac{m_b}{v} h \bar{b}b - c_b \frac{m_\tau}{v} h \bar{\tau}\tau \\
 & + c_g \frac{\alpha_s}{12\pi v} h G_{\mu\nu}^a G_{\mu\nu}^a + c_\gamma \frac{\alpha}{\pi v} h A_{\mu\nu} A_{\mu\nu} \\
 & + c_\chi h \bar{\chi}\chi
 \end{aligned}$$

- Extending effective theory to add invisible width
- Here  $\chi$  is a new collider stable particle, possibly constituting part of all of dark matter in the Universe
- Existing LHC data already constraint the invisible width  
[Djouadi,AA,Mambrini,Quevillon \[1205.3169\]](#)

# Constraining invisible width

- CMS monojet search EXO-11-059 updated to 5 fb-1
  - at least 1 jet with  $p_T^j > 110$  GeV and  $|\eta^j| < 2.4$ ;
  - at most 2 jets with  $p_T^j > 30$  GeV;
  - no isolated leptons;
  - missing transverse momentum  $p_T^{\text{miss}} \geq 200 - 400$  GeV.
- Event yield dominated by backgrounds (mostly  $Z \rightarrow \nu\nu + \text{jets}$  and  $W \rightarrow \nu l + \text{jets}$ ) with systematics at about 10%.
- For example, for  $p_T^{\text{miss}} \geq 350$  GeV CMS observes 1142 events vs predicted background  $1224 \pm 101$
- For Higgs with SM cross section fully invisible additional  $\sim 100$  events, comparable to errors

(red = ggH, blue = VBF)

# Constraining invisible width

$p_T^{\text{miss}}$	$N_{\text{inv}}^{\text{ggF}}$	$N_{\text{inv}}^{\text{VBF}}$	$\Delta N_{\text{Bkg}}$	$R_{\text{inv}}^{\text{exp}}$	$R_{\text{inv}}^{\text{obs}}$
200	630	260	$\sim 1200$	2.6	1.8
250	250	110	$\sim 380$	2.0	1.3
300	110	50	$\sim 170$	2.1	2.2
350	46	25	101	2.8	1.6
400	22	13	$\sim 70$	3.8	2.3

$$R_{\text{inv}}^{\text{ggF}} \equiv \frac{\sigma(\text{gg} \rightarrow h)}{\sigma_{\text{SM}}(\text{gg} \rightarrow h)} \text{Br}(h \rightarrow \text{inv}) \leq 1.9 \quad @ 95\% \text{CL}$$

$$R_{\text{inv}}^{\text{VBF}} \equiv \frac{\sigma(\text{qq} \rightarrow \text{hqq})}{\sigma_{\text{SM}}(\text{qq} \rightarrow \text{hqq})} \text{Br}(h \rightarrow \text{inv}) \leq 4.3 \quad @ 95\% \text{CL}$$

Combining (assuming SM proportions of ggF and VBF),

$$R_{\text{inv}} \equiv \frac{\sigma(\text{pp} \rightarrow h) \text{Br}(h \rightarrow \text{inv})}{\sigma(\text{pp} \rightarrow h)_{\text{SM}}} < 1.0(1.3) \quad @ 90(95)\% \text{CL}$$

(Ignoring theory errors)

# Constraining invisible width

$$R_{\text{inv}} \equiv \frac{\sigma(pp \rightarrow h)\text{Br}(h \rightarrow \text{inv})}{\sigma(pp \rightarrow h)_{\text{SM}}} < 1.0 \quad (1.3) \quad @ 90(95)\%CL$$

- No direct constraints on the invisible branching fraction yet if Higgs produced with the SM rate
- However if Higgs rate enhanced (as for example in the presence of the 4th chiral generation) then our analysis provides non-trivial constraints
- This was just a recast of the large extra dimension search. A designated search could give better bounds?
- Indirectly, a better bound  $\text{Br}(h \rightarrow \text{inv}) < 0.4$  from observation of visible Higgs decays [Giardino+ \[1203.4254\]](#)
- Interesting interplay between LHC and direct dark matter detection in the context of Higgs portal models

What If ?

- Current combined Higgs data allow, while Tevatron and VBF  $\gamma\gamma$  channel in CMS favor increased Higgs coupling to  $WW$  and  $ZZ$
- What if indeed  $c_V > 1$ ?

- If SM Higgs doublet mixes with a singlet or another doublet, then always  $c_V = \cos \alpha < 1$ . Thus enhancement impossible in typical SUSY models.
- For Higgs being a pseudo-Goldstone boson of any compact coset (Little Higgs and composite Higgs), also  $c_V = \cos(v/f) < 1$ . Again, enhancement of  $c_V$  impossible
- [Low et al \[0907.5413\]](#) : sum rule proving  $c_V > 1$  implies charge-2 Higgs
- [AA et al \[1202.1532\]](#) : stronger sum rule (assuming custodial symmetry)

$$1 - c_V^2 \approx \frac{v^2}{6\pi} \int_0^\infty \frac{ds}{s} (2\sigma_{I=0}^{\text{tot}}(s) + 3\sigma_{I=1}^{\text{tot}}(s) - 5\sigma_{I=2}^{\text{tot}}(s)) .$$

- $c_V > 1$  implies enhancement of isospin 2 channel of WW scattering

## Simplest realization of isospin 2 enhancement

- **Quintuplet** of weakly coupled scalars  $Q = (Q^{--}, Q^-, Q^0, Q^+, Q^{++})$
- Coupled to electroweak gauge bosons in custodially invariant way

$$\frac{g_Q}{v} \left\{ \sqrt{\frac{2}{3}} Q^0 \left( m_W^2 W_\mu^+ W_\mu^- - m_Z^2 Z_\mu^2 \right) + \left( Q^{++} m_W^2 W_\mu^- W_\mu^- + \sqrt{2} Q^+ m_W m_Z W_\mu^- Z_\mu + \text{hc} \right) \right\}$$

- Sum rule fulfilled for

$$g_Q^2 = \frac{6}{5} (c_V^2 - 1)$$

- What is special about  $g_Q^2 = 6/5(c_V^2 - 1)$  ?
- Quintuplet, much like Higgs, contributes to WW scattering but, unlike Higgs, it has *opposite* couplings to W and Z
- For generic  $ab \rightarrow cd$  process in the limit  $g' \rightarrow 0$

$$A(s, t, u)\delta^{ab}\delta^{cd} + A(t, s, u)\delta^{ac}\delta^{bd} + A(u, t, s)\delta^{ad}\delta^{bc}$$

For example  $A_{W^+W^- \rightarrow ZZ} = A(s, t, u)$ ,

$A_{W^+W^+ \rightarrow W^+W^+} = A(t, s, u) + A(u, t, s)$ , etc

- Isospin singlet and quintuplet contribute as [Alboteanu et al \[0806.4145\]](#)

$$A(s, t, u) = \frac{s}{v^2} \left( 1 - c_V^2 \frac{s}{s - m_h^2} \right) + \frac{g_Q^2}{v^2} \left( \frac{s^2}{3(s - m_Q^2)} - \frac{t^2}{2(t - m_Q^2)} - \frac{u^2}{2(u - m_Q^2)} \right)$$

- For  $s \gg m_{h,Q}^2$

$$A(s, t, u) \approx \frac{s}{v^2} \left( 1 - c_V^2 + \frac{5g_Q^2}{6} \right)$$

Higgs overshoots unitarization, but for  $g_Q^2 = 6/5(c_V^2 - 1)$  quintuplet restores unitary behavior as long as  $m_Q$  is not too large

- Quintuplet can be part of renormalizable Higgs sector provided one allows for higher-than-doublet representations under  $SU(2)_W$
- Minimal model: scalar  $\Phi$  in  $(3, 3)$  representation under *global*  $SU(2) \times SU(2)$  (complex triplet + real triplet under  $SU(2)_W$ )
- Under custodial isospin  $\Phi$  decomposes as singlet + triplet + quintuplet

$$\left( \begin{array}{ccc} \frac{v}{2\sqrt{2}} + \frac{1}{\sqrt{3}}h - \frac{1}{\sqrt{6}}Q^0 + \frac{i}{\sqrt{2}}\pi^0 & -\frac{1}{\sqrt{2}}(Q^+ + i\pi^+) & -Q^{++} \\ -\frac{1}{\sqrt{2}}(Q^- + i\pi^-) & \frac{v}{2\sqrt{2}} + \frac{1}{\sqrt{3}}h + \sqrt{\frac{2}{3}}Q^0 & -\frac{1}{\sqrt{2}}(Q^+ - i\pi^+) \\ -Q^{--} & -\frac{1}{\sqrt{2}}(Q^- - i\pi^-) & \frac{v}{2\sqrt{2}} + \frac{1}{\sqrt{3}}h - \frac{1}{\sqrt{6}}Q^0 - \frac{i}{\sqrt{2}}\pi^0 \end{array} \right)$$

corresponding to  $c_V = \sqrt{8/3}$  and  $g_Q = \sqrt{2}$ .

- Smaller  $c_V$  can be obtained when  $\Phi$  mixes with EW singlet, or doublet (Georgi, Machacek [(1985)] )
- More general Higgs representations under  $SU(2) \times SU(2)$  studied in Low, Lykken [1005.0872]

- Custodial invariant coupling of Higgs and quintuplet:

$$\mathcal{L}_{hQQ} = -2g_{hQQ}m_Q^2 \frac{h}{v} \left( |Q^{++}|^2 + |Q^+|^2 + \frac{1}{2}(Q^0)^2 \right).$$

Minimal renormalizable model:  $g_{hQQ} = \sqrt{\frac{2}{3}} \frac{m_h^2 + 2m_Q^2}{m_Q^2}$

- Shifts effective Higgs coupling to  $\gamma\gamma$  by

$$\delta c_\gamma \approx \frac{5}{24} g_{hQQ}$$

- Thus, generic prediction of increased Higgs couplings to WW and ZZ, and decreased effective Higgs coupling to photons

- The puzzle of electroweak symmetry breaking is about to be solved
- Hints from the LHC and other experiments consistently point to weakly coupled electroweak symmetry breaking with a light Higgs boson
- Measuring Higgs coupling may soon give us strong hints favoring or disfavoring particular models beyond the Standard Model
- If data clearly points to  $c_V > 1$ , all hands on board to search for 5 more Higgs bosons!
- At least *this year* is going to be exciting...
